DETAILED ACTION

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-4 are rejected under 35 U.S.C. 103(a) as being unpatentable over Nomura et al (US 5,319,517) in view of JP 11-103022 ('022). Nomura disclose a method of making a multilayer ceramic capacitor (See abstract). The method comprises firing a green chip to be a capacitor element body comprising dielectric layers and internal electrode layers in a reducing atmosphere (See Col. 10, lines 50-56) and performing a heat processing under an atmosphere in which the oxygen partial pressure is higher than the reducing atmosphere (See Col. 10, lines 59-63). Nomura is silent disclosing the size of the particles making up the dielectric layers. However, '022 teaches that particles of dielectric layers have a diameter larger than the thickness of the dielectric layer (See machine translation of paragraph 7) in order to provide a specific inductive capacity, high insulation, and reducing crack initiation (see machine paragraphs 4-5). Hence, at the time the invention was made it would it have been obvious to a person of ordinary skill in the art to have used particles of dielectric layers have a diameter larger than the thickness of the dielectric layer for Nomura's capacitor in order to provide a specific inductive capacity, high insulation, and reduction in crack initiation as taught by '022.

Art Unit: 1731

As for claim 2, the temperature after firing is 1000°C as shown in Col. 10, lines 59-65 of Nomura.

As for claims 3-4, the oxygen partial pressure is 10^{-3}Pa as shown in Col. 10, lines 59-65 of Nomura.

Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.
